

Grassroots-startup : A block-chain based credit system for much evenly distributed business and job opportunities for everyone

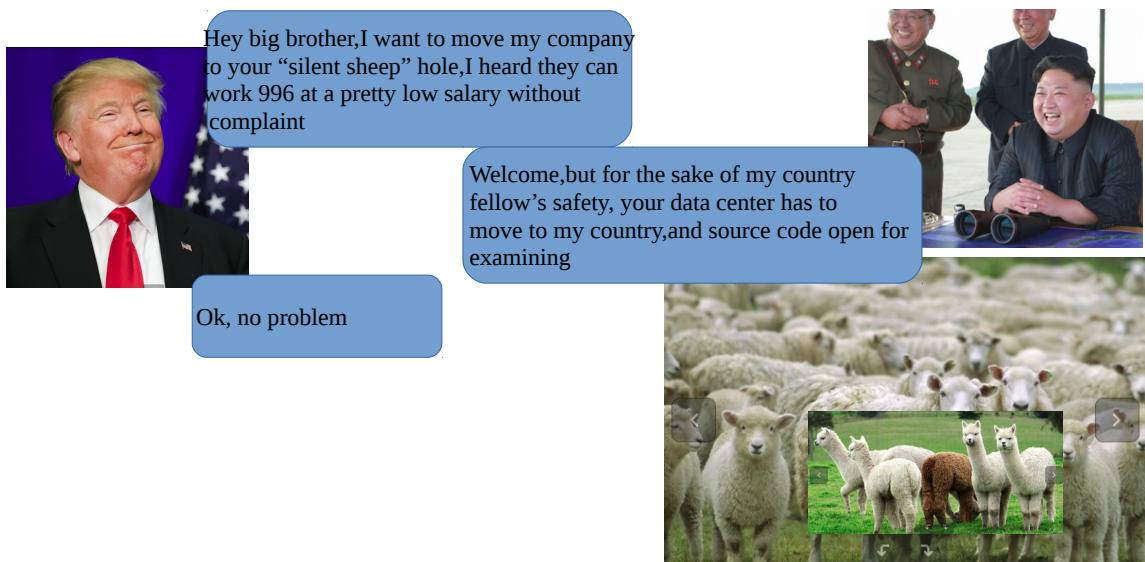

<http://www.grassrootsstartup.org/>

we are trying to build an organization which decentralizes a lot of things, so that opportunities can be more evenly distributed among people from every country. The rise of AI power should help guarantee that people have more decent work.

*Two key technologies are applied here: 1. **Block-chain**. 2. **decentralized social networking system** for free network access from every country, so that no country can block it.*

problems we are facing in global economy competition :

- **civilization such as good labor union and high welfare have become a stumbling block in global economic competition.** Countries with centralized power, their labor union is buried underground, people are forced to work overtime for free or paid very less in a smart and legal way. People doing the same work are paid way less than these in civilized countries. for instant in some countries the famous term for that is 996(start from 9AM,end at later than 9PM,6 days a week). The solution to this is approximately equal pay for equal work and equal time and with equal rights. **Compete fairly, it is a shame to compete with any anti-civilization drug takers and ‘chicken soup’ Brain-Washer.**

- **People in countries with high civilization are losing their jobs gradually.** High-tech companies moving to the “silent sheep” hole, technology will never be a eternal barrier for many countries, especially with high quality educational resources now becoming international on line for everyone.

Hmm, this bargain is so nice, saving me a lot of money

How come, you have many supper skills

Dad, I have been laid off

My company XXAI is moving to "silent sheep" hole. I am considering to go there to get a job

- **Economic war will cause the nationalist to rise.** Nationalist is just a tiny step away from Nazi, these people are the cheapest group of people that can be manipulated. Rich people from different countries walk hand in hand, nationalist from different countries spitting to each other on the streets. It is an art to control a group of grassroots by just manipulating a small group of so called elites, who are being labeled as the successful models for the rest of people by the centralized media.
- **The centralized power gets stronger with the help of AI, the weaker and more silent their people will become.** People in countries with centralized power needs help from the outside. Helping them helps yourselves.

The key reasons why smart engineers have become silent sheep :

- **weak labor union** which mostly do things like arranging a dating party for single engineers who are kept busy coding. So people easily get laid off if them don't work in 996 style.
- **People get laid off because of their so-called 'wrong speech' in countries with centralized power.** These includes some professors and engineers.
- **Not much options they can choose from.** As the capital and technology have accumulated over several decades, opportunities has become more and more centralized.

What we can do to help solve the problem :

we establish a organization named **grassroots-startup** which aimed to provides more evenly distributed business and job opportunities for everyone in the world, by voting mechanism from massive users, statistically we expect to reach an ideal situation: "equal pay for the

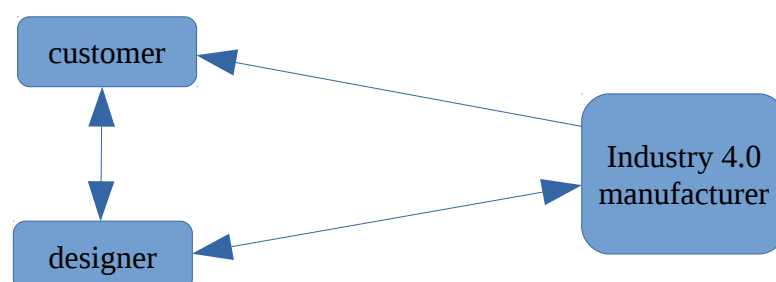

equal work,better pay for the better record everywhere”. Hopefully this organization will survive on donation, better service for better donation.

We utilize two key technologies here:

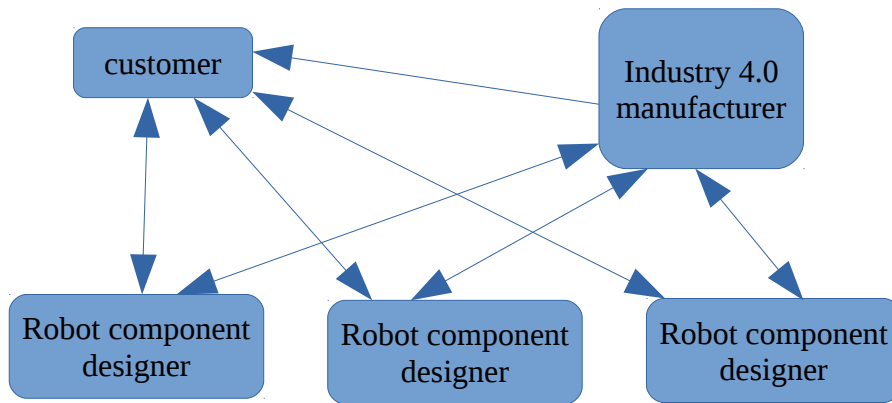

- **block-chain**, which build up a trust system and punish evil players.
- **Decentralized social networking system**, which ensure that this organization’s website will never be blocked from any countries, and also build up a military level secure encrypted and distributed communication system for everyone.

Main functionalities the organization will provide :

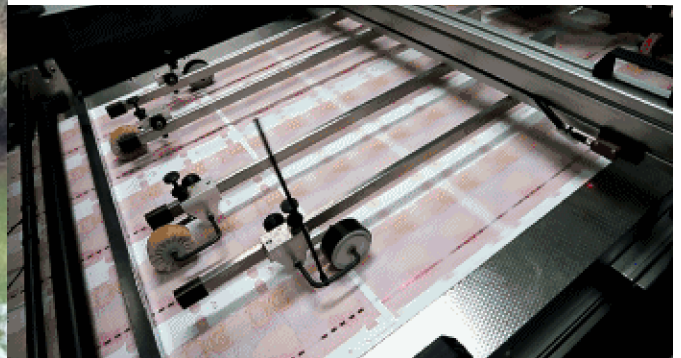

- **free engineering training course** which aims to help people build their skills to build prototype or make products that can sale, so they can team-up to form a start-up. This is different from existing training course which most provides theory kind of training, we are going to share our engineering experience with people on how to implement algorithms into a product.
- **Block-chain based crow-funding investment.** This is different from kickstarter alike companies, the supporter can choose to buy product or invest, so everyone get chance to make smart investment.
- **More opportunities for the grassroots startups to get funding support.**
- **More opportunities for grassroots engineers**, by providing both full time or part time opportunities to help them increase income.
- **Block-chain based record.** Evil player gets punished publicly, so that they will not likely to have second chance to cheat. This ensures the trust and credit. Better opportunities for better record.
- **Helping products.** Some companies can share some of their products’ profit to support some small start-ups,so they can hire more engineers with decent salary and good working rights.
- **Heads up stories to share and blacklist**
- **customer to designer direct business mode.** Where industry 4.0 comes in play.

- **More component module providers**,so that customer can assembling an intelligent root from different robot module vendors. Industry 4.0 comes in play.

- **Secure the website can be accessed from all over the world by using the decentralized social networking system.**
- **Community work for evil players to regain trust from the public.**
